

# Data Science for Non Programmer

## Day 04: Data Preprocessing

Fariz Darari, Ph.D.  
Radityo Eko Prasojo, Ph.D.

# Menu

---

- Why preprocess data?
- Data collection and loading
- Data cleaning
- Data selection
- Data enrichment
- Data transformation
- Data integration
- Data reduction
- Data balancing

# Why preprocess data?

- You may have data, but your data might not be ready to be processed
- Not all components of your data can be useful
- Moreover, real world data tends to be:
  - Inconsistent, incompatible, not regular
  - Noisy, contains errors or outliers
  - Incomplete, contains missing values
- Your data can be (heavily) imbalanced

# Quiz: Can you spot any issues?

| No | Employee ID | Name   | Position          | Company | Monthly Salary (in IDR) |
|----|-------------|--------|-------------------|---------|-------------------------|
| 1  | E012        | Andi   | Software Engineer | PT ABC  | 7000000                 |
| 2  | E123        | Budi   | Web Developer     | PT ABC  | 6000000                 |
| 3  | E321        | Ani    | HR Manager        | PT ABC  | 6 juta                  |
| 4  | E222        | Endang | CTO               | PT ABC  | 12000000                |
| 5  | E555        | Sarah  | CEO               |         | 15000000                |
| 6  | Z012        | Boy    | Software Engineer | PT DEF  | 8000000                 |
| 7  | Z123        | Tom    | Web Developer     | PT DEF  | 700000000               |
| 8  | Z321        | Julia  | HR Manager        | PT DEF  | 7000000                 |
| 9  | Z222        | Dedy   | CTO               | PT DEF  | 13000000                |
| 10 | Z555        | Sinta  | CEO               | PT DEF  | 16000000                |

# Potential data issues: Case study of survey data

- Respondents only answering a portion of questions
- Respondents not meeting our target criteria
- Respondents speeding thru our survey
- Straightline respondents
- Respondents giving unrealistic answers
- Respondents giving contradictory responses

# Data collection: Google Dataset Search

The screenshot shows the Google Dataset Search interface. At the top, the Google logo is on the left, and a search bar contains the text "coronavirus covid-19" with a magnifying glass icon on the left and a close 'X' icon on the right. Below the search bar, there are five filter buttons: "Last updated", "Download format", "Usage rights", "Topic", and "Free". The search results are displayed in two columns. The left column shows three results: 1. "Our World in Data" with the title "Coronavirus Disease (COVID-19) – the data", URL "ourworldindata.org", and a "CSV" download option. 2. "World Health Organization" with the title "WHO Coronavirus disease (COVID-19) situation dashboar...", URL "experience.arcgis.com". 3. "University of Washington" with the title "Novel Coronavirus (COVID-19) Infection Map", URL "hgis.uw.edu", and a "CSV" download option. The right column shows a detailed view of the first result: "Our World in Data" with the title "Coronavirus Disease (COVID-19) – the data". It includes a blue button "Explore at Our World in Data", the text "99 scholarly articles cite this dataset (View in Google Scholar)", a "CSV" download option, and information about the dataset provider "Our World in Data" and the license "Attribution 4.0 (CC BY 4.0)".

# Data loading

- Data formats: Excel (xls andxlsx), Google Sheets, CSV (Comma-Separated Value), TSV (Tab-Separated Value), Orange format
- All can be called: Tabular format
- Tabular format: Table with data instances (samples) in rows and data attributes in columns

# Data anatomy

---

Data is divided into:

- Attributes/features

The variables used to predict the class variable

- Target variable

The variable whose value is to be predicted based on the attributes

- Meta attributes

Additional data, not used for the prediction

# Data anatomy example

| No | Employee ID | Name   | Position          | Company | Monthly Salary (in IDR) |
|----|-------------|--------|-------------------|---------|-------------------------|
| 1  | E012        | Andi   | Software Engineer | PT ABC  | 7000000                 |
| 2  | E123        | Budi   | Web Developer     | PT ABC  | 6000000                 |
| 3  | E321        | Ani    | HR Manager        | PT ABC  | 6000000                 |
| 4  | E222        | Endang | CTO               | PT ABC  | 12000000                |
| 5  | E555        | Sarah  | CEO               | PT ABC  | 15000000                |
| 6  | Z012        | Boy    | Software Engineer | PT DEF  | 8000000                 |
| 7  | Z123        | Tom    | Web Developer     | PT DEF  | 7000000                 |
| 8  | Z321        | Julia  | HR Manager        | PT DEF  | 7000000                 |
| 9  | Z222        | Dedy   | CTO               | PT DEF  | 13000000                |
| 10 | Z555        | Sinta  | CEO               | PT DEF  | 16000000                |

Which are the target variable, features, and meta attributes?

# Data types

There are 4 main types of attributes:

- Categorical, for example: Female/Male, Low/Med/High, No/Yes
- Numeric: 1, 2.4, 5000000
- Text: "this is a text", "semangattt nge-data science!", "joe biden"
- Datetime: 2016-01-01 16:16:01, 2021-01-21

# Data types example

| No | Employee ID | Name   | Position          | Company | Monthly Salary (in IDR) |
|----|-------------|--------|-------------------|---------|-------------------------|
| 1  | E012        | Andi   | Software Engineer | PT ABC  | 7000000                 |
| 2  | E123        | Budi   | Web Developer     | PT ABC  | 6000000                 |
| 3  | E321        | Ani    | HR Manager        | PT ABC  | 6000000                 |
| 4  | E222        | Endang | CTO               | PT ABC  | 12000000                |
| 5  | E555        | Sarah  | CEO               | PT ABC  | 15000000                |
| 6  | Z012        | Boy    | Software Engineer | PT DEF  | 8000000                 |
| 7  | Z123        | Tom    | Web Developer     | PT DEF  | 7000000                 |
| 8  | Z321        | Julia  | HR Manager        | PT DEF  | 7000000                 |
| 9  | Z222        | Dedy   | CTO               | PT DEF  | 13000000                |
| 10 | Z555        | Sinta  | CEO               | PT DEF  | 16000000                |

Which are the suitable types of each attribute?

# XLSX vs. CSV

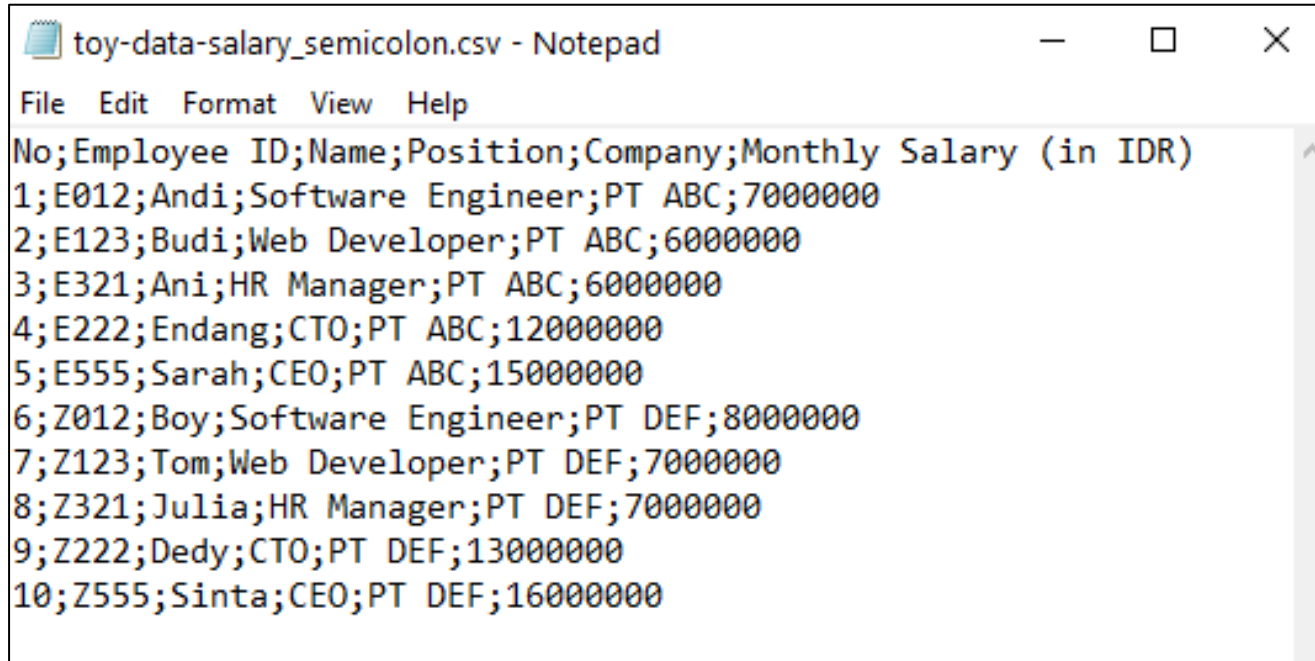

| XLSX  | CSV   |
|---|---|
| Binary file, to be opened only by Microsoft Excel-compatible apps | Plain text file, can be opened by any text editor |
| Rich formatting   | Simple formatting                                 |
| Widespread usage in business context                              | Widespread usage in data science community        |

# Tips: What if the table is in PDF?

---

- Tables in PDF cannot be processed easily!
- Try using any PDF to Excel converter!
- Examples:
  - <https://pdftables.com/>
  - <https://smallpdf.com/pdf-to-excel>
  - <https://simplypdf.com/Excel>

# Data cleaning

- Dirty data is inevitable, there is no perfect data existing right from the beginning
- Data cleaning is the process of fixing data, removing problematic parts of the data

| Category         | Dimension                    | Definition: the extent to which ...  |
|------------------|------------------------------|--|
| Intrinsic        | Believability                | data are accepted or regarded as true, real and credible                               |
|                  | Accuracy                     | data are correct, reliable and certified free of error                                 |
|                  | Objectivity                  | data are unbiased and impartial  |
|                  | Reputation                   | data are trusted or highly regarded in terms of their source and content               |
| Contextual       | Value-added                  | data are beneficial and provide advantages for their use                               |
|                  | Relevancy                    | data are applicable and useful for the task at hand                                    |
|                  | Timeliness                   | the age of the data is appropriate for the task at hand                                |
|                  | Completeness                 | data are of sufficient depth, breadth, and scope for the task at hand                  |
|                  | Appropriate amount of data   | the quantity or volume of available data is appropriate                                |
| Representational | Intepretability              | data are in appropriate language and unit and the data definitions are clear           |
|                  | Ease of understanding        | data are clear without ambiguity and easily comprehended                               |
|                  | Representational consistency | data are always presented in the same format and are compatible with the previous data |
|                  | Concise representation       | data are compactly represented without being overwhelmed                               |
| Accessibility    | Accessibility                | data are available or easily and quickly retrieved                                     |
|                  | Access security              | access to data can be restricted and hence kept secure                                 |

# Dirty data: Examples

- Number of employees: -5
- Age of Bob: 240 years old
- Dates of birth of Fariz:  
27 Jan 1992 and 10 Mar 1990
- Gender = Male, Pregnant = Yes
- Married = N/A

# Dirty data: Examples

| Student ID | Student Name | Age | GPA | Classification |
|------------|--------------|-----|-----|----------------|
| 100122014  | Joseph       | 21  | 3.5 | Junior         |
| 100232015  | Patrick      | 200 | 3.2 | Sophomore      |
| 100122012  | Seller       | 24  | 3.0 | Senior         |

# Data imputation

---

- Real-world datasets may contain missing values
- Missing data may be due to:

# Data imputation

- Real-world datasets may contain missing values
- Missing data may be due to: equipment malfunction, inconsistent with other recorded data and thus deleted, data not entered due to unclear instructions, certain data may not be considered important
- Missing values may decrease the predictive performance of our models
- An easy way to deal with those missing values is just by simply throwing away parts of data with the missing values
- A better strategy: Data imputation, that is, inferring the missing values from the existing data

# Data imputation: Zero or any other constant

|          | col1 | col2 | col3 | col4 | col5 |

# Tips: Which columns to select?

- We can rank columns/attributes according to their correlation with target variable
- Determinant attribute: An attribute with a strong correlation to target variable
- For example, the attribute Discount Rate might strongly correlate with Buy Decision
- There can be several attributes influencing the target variable

# Tips: Which columns to select?

Task: Lung disease prediction  
Data: Medical records

| X                 |         |                |           |

# Data transformation: Discretization

---

Divides the numeric data into  $n$  groups

# Data transformation: Discretization

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal width discretization ( $n = 3$ ):

# Data transformation: Discretization

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal width discretization ( $n = 3$ ):

- Group 1 for  $[-, 10)$ : 0, 4
- Group 2 for  $[10, 20)$ : 12, 16, 16, 18
- Group 3 for  $[20, +)$ : 24, 26, 28

# Data transformation: Discretization

Divides the numeric data into n groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal width discretization ( $n = 3$ ):

- Group 1 for  $[-, 10)$ : 0, 4
- Group 2 for  $[10, 20)$ : 12, 16, 16, 18
- Group 3 for  $[20, +)$ : 24, 26, 28

# Data transformation: Discretization

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal frequency discretization ( $n = 3$ ):

# Data transformation: Discretization

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal frequency discretization ( $n = 3$ ):

- Group 1: 0, 4, 12
- Group 2: 16, 16, 18
- Group 3: 24, 26, 28

# Data transformation: Discretization

Divides the numeric data into n groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal frequency discretization ( $n = 3$ ):

- Group 1: 0, 4, 12
- Group 2: 16, 16, 18
- Group 3: 24, 26, 28

# Quiz: Discretization

---

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal width discretization ( $n = 2$ ):

# Quiz: Discretization

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal width discretization ( $n = 2$ ):

- Group 1 for  $[-, 14)$ : 0, 4, 12
- Group 2 for  $[14, +)$ : 16, 16, 18, 24, 26, 28

# Quiz: Discretization

---

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal frequency discretization ( $n = 2$ ):

# Quiz: Discretization

Divides the numeric data into  $n$  groups

Example data: 0, 4, 12, 16, 16, 18, 24, 26, 28

Equal frequency discretization ( $n = 2$ ):

- Group 1: 0, 4, 12, 16, 16
- Group 2: 18, 24, 26, 28

# Data transformation: Continuization

- Transforming discrete values (categorical) into continuous ones (numeric)
- One Hot Encoding: One feature per value, creates columns for each value, place 1 whenever an instance has that value and 0 otherwise

# Data transformation: Continuization

## ONE-HOT ENCODING

| Feature | Apple | Pear |
|---------|-------|------|
| Apple   | 1     | 0    |
| Pear    | 0     | 1    |
| Apple   | 1     | 0    |
| Pear    | 0     | 1    |
| Apple   | 1     | 0    |

One-hot encoding allows us to turn nominal categorical data into features with numerical values, while not mathematically imply any ordinal relationship between the classes.

ChrisAlbon

# Quiz: One Hot Encoding

| Pet    |
|--------|
| Cat    |
| Dog    |
| Turtle |
| Fish   |
| Cat    |

# Quiz: One Hot Encoding

| Pet    | Cat | Dog | Turtle | Fish |
|--------|-----|-----|--------|------|
| Cat    | 1   | 0   | 0      | 0    |
| Dog    | 0   | 1   | 0      | 0    |
| Turtle | 0   | 0   | 1      | 0    |
| Fish   | 0   | 0   | 0      | 1    |
| Cat    | 1   | 0   | 0      | 0    |

# Data transformation: Normalization

- Different features may have different scales
- Features with the larger scale might dominate other features unfairly
- Min-max normalization: For a feature, the min value of that feature is transformed into a 0, the max value into a 1, and every other value gets transformed into a decimal between 0 and 1

# Data transformation: Normalization

# Data transformation: Normalization

# Data transformation: Feature extraction

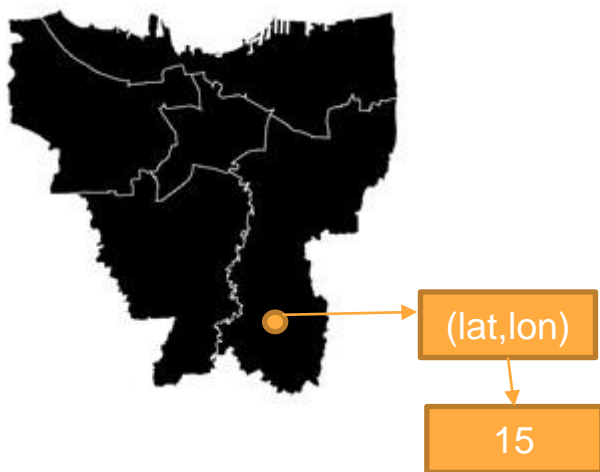

---

- In general: a more complex discretization/continuation
- E.g.: transforming coordinate features into discretized blocks on map
- E.g.: transforming textual data into bag-of-words

# Feature extraction: coordinate $\rightarrow$ block mapping

# Feature extraction: coordinate $\rightarrow$ block mapping

# Feature extraction: coordinate → block mapping

| No | Lat | Lon | Blok | Price    |
|----|-----|-----|------|----------|
| 1  | 111 | 222 | 6    | 1 Miliar |
| 2  | 333 | 444 | 6    | 2 Miliar |
| 3  | 555 | 666 | 11   | 500 juta |
| 4  | 777 | 888 | 11   | 700 juta |
| 5  | 999 | 000 | 11   | 600 juta |

# Feature extraction: coordinate → block mapping

| No | Lat | Lon | Blok | Price    |
|----|-----|-----|------|----------|
| 1  | 111 | 222 | 6    | 1 Miliar |
| 2  | 333 | 444 | 6    | 2 Miliar |
| 3  | 555 | 666 | 11   | 500 juta |
| 4  | 777 | 888 | 11   | 700 juta |
| 5  | 999 | 000 | 11   | 600 juta |

# Feature extraction: twitter profiling with bag-of-words

Twitter crawler → collect tweets containing COVID-related words for User A and B

|        | “Bohong” | “Hoax” | “Konspirasi” | “Vaksin” |
|--------|----------|--------|--------------|----------|
| User A | 1000     | 900    | 600          | 1000     |
| User B | 1        | 1      | 2            | 2000     |

# Data integration

- Data might come from a variety of sources
- We first have to collect them, resulting in data within separate files
- Next step is, how to integrate/merge such data?
- Two potential approaches:
  - Vertical merging: Two datasets with the same attributes are merged into one. For example, two datasets of 7 and 3 instances yield a new set of 10 instances.
  - Horizontal merging: Merging datasets with different attributes over the same instances.

# Vertical merging (Concatenation)

# Data reduction

---

- Getting a subset of the original data, in case the original data is too large
- Data reduction types:
  - Fixed proportion of data, return a selected percentage of the entire data (for example, 50% of all the data)
  - Fixed size (for example, 1000 rows)

# Data reduction: 50% proportion

# Data balancing

- Imbalanced data might lead to biased data analysis
- In this case, the class distribution needs to be adjusted
- Examples of imbalanced data:
  - Fraud detection
  - Ad serving
  - Transportation failure
  - Medical
  - Content moderation

# Data balancing

# Data balancing: Undersampling and oversampling

## Undersampling

## Oversampling

# Data balancing: Undersampling and oversampling

**Sampling:** Rebalancing  
the dataset

Imbalanced Data

Under-sampling

Over-sampling

# Data balancing: Undersampling and oversampling

SMOTE (Synthetic Minority Oversampling TEchnique) consists of synthesizing elements for the minority class, based on those that already exist

# Conclusions

---

- Data preprocessing is a key step in data science
- Garbage-In, Garbage-Out
- Data preprocessing includes a wide range of techniques from data cleaning to data balancing
- Data preprocessing can lead to better, faster decision making in the long run

# Hands on

- Demo using toy example
- Group task 1: play around with the Automobile dataset. What kind of preprocessing pipelines you would use? Try to perform a regression to predict the car price, did the preprocessing change the results? Next, instead of regression, try to classify the car into 2 classes: cheap and expensive.
- Group task 2: do the same as above but for the adult dataset
